

A2

7. A hub for a high speed flywheel system, comprising:
a flywheel hub having radial splines;
a flywheel rim liner having radial projections mating with said splines to form a torque transmitting coupling between said hub and said liner that maintains concentricity between said hub and said rim liner;
said flywheel rim liner made of a material having a strain-to-failure capability and a ratio R_f equal to E_f/ρ_f , wherein E_f is a hoop modulus of elasticity of said rim liner and ρ_f is the density of said rim liner material;
said rim liner strain-to-failure capability and ratio R_f being such that said rim liner remains in compressive contact with said rim from start to maximum speed of said flywheel system.

A3

10. A process of coupling a flywheel rim to a flywheel hub, comprising:
mounting said rim on a rim liner; and
coupling said rim liner to said hub with a torque coupling that allows said liner to grow radially with respect to said hub while remaining concentric thereto during high speed operation.

A4

16. A flywheel system as defined in claim 15, wherein:
said coupling includes an array of radial projections spaced angularly around said liner extending into radial grooves in said hub.
